The 25th round of Special Representatives (SR) talks between India's National Security Adviser Ajit Doval and Chinese Foreign Minister Wang Yi in Beijing marks a significant shift from tactical disengagement to strategic risk management. The discussions focused on border delimitation, maintaining peace along the Line of Actual Control (LAC), and restoring broader bilateral ties ahead of key diplomatic events.

India, China push for border delimitation

Both countries stress peace in border areas at the 25th Special Representatives' talks

Ananth Krishnan
BEIJING

India and China on Tuesday said they had discussed advancing talks on delimiting parts of the disputed border, as National Security Adviser Ajit Doval and Chinese Foreign Minister Wang Yi met in Beijing.

A statement from the Indian Embassy here said both sides had "discussed ways to further expand bilateral cooperation, maintain stability, and ensure peace and tranquility in the border areas, and make progress on boundary delimitation, while sustaining the ongoing work on transboundary cooperation."

China's Foreign Ministry highlighted progress on border delimitation in a statement issued after the 25th round of talks between the two Special Representatives (SR) on the

boundary question, saying both sides "held in-depth discussions on advancing border delimitation negotiations, strengthening border management and control, improving mechanism building and promoting cross-border cooperation." But neither side provided details on which parts of the Line of Actual Control (LAC) were being explored for possible delimitation. At last year's SR talks, both sides agreed to set up a working group to explore "early harvest" border delimitation in some areas along the LAC.

On broader bilateral ties, Mr. Doval said Prime Minister Narendra Modi and Chinese President Xi Jinping had given "a clear and positive direction" to the relationship which has been "steadily returning to normalcy". He noted that this round of SR talks was "very important particularly in the wake of the

Ties 'returning to normalcy', says Doval; both nations should learn from history, says Wang

National Security Adviser Ajit Doval holds talks with Chinese Minister Wang Yi in Beijing. ANANTH KRISHNAN

BRICS Summit to happen shortly."

Xi likely to visit Delhi

Mr. Xi is expected to attend the September 12 meet in New Delhi, on his first visit to India in seven years.

The Chinese statement quoted Mr. Wang as saying "China and India should draw lessons from history, place the boundary ques-

tion appropriately in bilateral relations, and keep moving forward without stagnating, backtracking or veering off course."

The Chinese Foreign Minister said that besides resuming the SR talks last year, institutional mechanisms between the two countries were resuming and both sides have been "working hard to maintain

peace and tranquility in the border areas."

At last year's talks, he noted both sides "reached a set of common understandings on delimitation, on border management, mechanism building and cross border cooperation." "Over the past year, our two sides have worked to deliver them on the ground and have made

Doval says PM Modi and Chinese President Xi are giving 'clear and positive direction' to ties

good progress," he said. The Chinese statement said the two sides "reaffirmed their commitment to the 2005 Political Guiding Principles, and, in a spirit of mutual respect and mutual understanding, will leverage the Special Representatives' mechanism to pursue a fair, reasonable and mutually-acceptable package solution to the boundary question."

Earlier on Tuesday, Mr. Doval called on Chinese Vice-President Han Zheng.

Both sides were positive in their descriptions of the on-going normalisation of relations. "I am happy over the past year our relationship has been steadily returning to normalcy," Mr. Doval said. "The normalcy we have witnessed in our relationship has been a direct result of both sides maintaining peace and tranquility in the border areas."

According to the Chinese statement, Mr. Wang called for "gradually building a positive narrative on China-India boundary affairs, making dialogue, peace, consultation and cooperation the mainstream and injecting positive factors into the sound and stable development of bilateral relations".

"China stands ready to work with India to guide bilateral relations from a strategic and long-term perspective, deepen mutual understanding, resolve differences, overcome obstacles, become good-neighbourly friends and mutually-beneficial partners, and achieve the 'Dragon-Elephant Dance,'" he said, adding that the "China India relationship has gone beyond the bilateral scope and taken on global significance."

IMMEDIATE PRIORITY
» PAGE 14

Key Highlights of the SR Talks

- **Border Delimitation Focus:** Both sides discussed advancing talks on boundary delimitation, building on the decision to establish an Expert Group under the Working Mechanism for Consultation and Coordination (WMCC) for "early harvest" agreements in less contentious LAC sectors.
- **Political Guidance:** Strategic direction provided by Prime Minister Narendra Modi and President Xi Jinping during their October 2024 Kazan interaction has catalyzed steady normalisation.
- **Leadership Engagement:** The talks pave the way for high-level interaction at the upcoming BRICS Summit in New Delhi.
- **Institutional Framework:** Both nations reaffirmed commitment to the **2005 Political Parameters and Guiding Principles** to seek a fair, reasonable, and mutually acceptable boundary solution.

'Border stability is an immediate priority'

'Institutionalising stability' on the border is the immediate task for both countries rather than expecting a sudden 'dramatic settlement', says Chinese strategic affairs scholar Hu Shisheng; both sides have incentive for a favourable political atmosphere for possible leader-level interaction, he adds

Ananth Krishnan
BEIJING

As India and China on Tuesday held the 25th round of border talks between National Security Adviser Ajit Doval and China's Foreign Minister Wang Yi in Beijing, Hu Shisheng, a leading Chinese strategic affairs scholar on South Asia, said "institutionalising stability" is the immediate task for both countries even as "structural differences" in the relationship remained. "On the border, I would expect the immediate focus to be less on a dramatic settlement and more on institutionalising stability. The priority is to prevent misunderstanding and miscalculation along the LAC, strengthen military

and diplomatic communication, and turn last year's idea of an 'early harvest' into an operational process," Mr. Hu, who is Director of the South Asia Institute at the China Institutes of Contemporary International Relations (CICIR) in Beijing, told *The Hindu*.

He was referring to an agreement at last year's 24th round on establishing an Expert Group under the Working Mechanism for Consultation and Coordination (WMCC) on border affairs to explore "early harvest on boundary delimitation".

Mr. Hu said the timing of Mr. Doval's visit, before the September 12 BRICS Summit in New Delhi, added significance to the visit with Mr. Xi expected to visit India.

A satellite image taken in June 2020 shows the Line of Actual Control and Patrolling Point 14 in the eastern Ladakh sector. AFP

"Both sides have a strong incentive to keep the border stable and create a favourable political atmosphere for possible leader-level interaction," he said, adding that he viewed maintaining stability on the border, achieving "concrete and

operational progress" on "early harvest" outcomes, and creating favourable conditions for the BRICS Summit as immediate priorities.

At the strategic level, he added, Mr. Doval's visit would help "clear potential obstacles ahead of the

BRICS Summit and lay the groundwork for possible leader-level engagement."

He added that ensuring no unexpected border incident before the summit, setting the political tone and identifying deliverables for a possible leaders' meeting, and coordinating the handover of the BRICS agenda from India to China, which takes over as chair next year, would be three essential issues on the table.

Gradual normalisation

The view in Beijing, as in Delhi, is that the normalisation in relations since the October 2024 meeting between Mr. Modi and Mr. Xi is likely to remain gradual and measured.

"As for the broader normalisation, I would de-

scribe it as strategic risk management rather than strategic realignment," Mr. Hu said.

"Recent difficulties in India-U.S. relations may give New Delhi greater incentives to diversify its strategic options, while the relative stabilisation of China-U.S. ties reduces some of the external pressure on China-India relations. But the structural differences between China and India have not disappeared. What we are seeing is an attempt to build a more stable form of competitive coexistence - keeping the border peaceful, restoring practical cooperation, and expanding coordination through BRICS and the Global South without pretending that strategic competition no longer exists."

Core Analysis: Operational Priorities & Strategic Realities

- **Institutionalising Border Stability:** Rather than expecting an immediate resolution to the complex boundary question, the immediate priority is managing operational risks, preventing military miscalculations, and establishing robust communication protocols.
- **Strategic Risk Management:** The current phase reflects "competitive coexistence." While both countries aim to stabilize economic and diplomatic ties, structural competition, strategic divergence in the Indo-Pacific, and historical distrust persist.
- **Geopolitical Drivers:** Shifting global dynamics—including fluctuations in U.S.-India trade and strategic alignment alongside temporary stabilization in U.S.-China ties—provide both Delhi and Beijing with tactical incentives to diversify their diplomatic options.

Static Dimensions & Civil Services Relevance

1. Boundary Question Mechanisms (GS Paper II)

- **Special Representatives (SR) Mechanism:** Established in 2003 to find a political solution to the boundary problem. Operates across three stages: agreeing on guiding principles, establishing a framework resolution, and delimiting borders on maps and ground.
- **2005 Agreement:** Outlines political parameters, emphasizing that settled populations must not be disturbed in any final settlement.

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

- **WMCC (2012):** Focuses on operational border management, consultation, and confidence-building measures (CBMs).

2. The Three Sectors of the India-China Border

- **Western Sector (Ladakh):** Disputed territory of Aksai Chin; differing perceptions of the LAC.
- **Middle Sector (Himachal Pradesh & Uttarakhand):** Relatively peaceful and settled; primary candidate for "early harvest" boundary delimitation.
- **Eastern Sector (Arunachal Pradesh & Sikkim):** China claims sovereignty over Arunachal Pradesh (South Tibet); India recognizes the McMahon Line.

3. Strategic & Multilateral Dimensions (GS Paper II & III)

- **Multilateral Platforms:** Cooperation in BRICS and SCO allows engagement despite bilateral friction, aiding global governance balance.
- **Economic Interdependence:** Managing high trade deficits alongside selective de-risking in critical technology, infrastructure, and investment sectors.

Key Challenges to Long-Term Stability

- **Lack of Clarified LAC:** Non-demarcation of the LAC leaves scope for localized standoffs, patrolling overlaps, and sudden escalations.
- **Asymmetric Infrastructure:** Accelerated Chinese infrastructure development along the border necessitates continuous defensive counter-investments by India.
- **Strategic Distrust:** Entrenched strategic competition across South Asia and the Indian Ocean Region limits rapid normalization.

Way Forward

- **Operationalize Early Harvests:** Delineate undisputed or less contentious sections (primarily in the Middle Sector) to build mutual trust.
- **Standardize Border Management Protocols:** Update existing CBMs to account for current troop deployments and advanced surveillance technologies.
- **Decouple Border Issues from Tactical Friction:** Institutionalize regular military-to-military communication to prevent localized tactical events from stalling macro-level diplomatic engagements.

The trajectory of India-China relations is moving toward structured risk management. By prioritizing border stability and steadying bilateral channels, both nations aim to substitute unpredictability along the LAC with a pragmatic model of competitive coexistence.

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

UPSC Prelims Practice Questions

Question: With reference to the India-China boundary dispute, consider the following statements:

1. The India-China boundary is conventionally divided into Western, Middle and Eastern sectors.
2. The Western Sector primarily involves the boundary between Ladakh and Aksai Chin.
3. The Middle Sector covers the boundary areas of Himachal Pradesh and Uttarakhand.
4. The Eastern Sector includes Arunachal Pradesh and Sikkim.

Which of the statements given above are correct?

- A. 1, 2 and 3 only
- B. 1, 3 and 4 only
- C. 2 and 4 only
- D. 1, 2, 3 and 4

Ans:D)

UPSC Mains Practice Questions

Question: "For India-China relations, peace and tranquillity along the Line of Actual Control is not merely a border-management objective but a prerequisite for broader bilateral normalisation." Discuss. **(10 Marks, 150 Words)**

At the 17th Conference of Parties (COP17) to the United Nations Convention to Combat Desertification (UNCCD) in Ulaanbaatar, Mongolia, India called for a fundamental global transition from **"reactive crisis management"** to **"proactive, technology-enabled resilience."** With over 40% of global land degraded, droughts have transformed from transient meteorological anomalies into systemic socio-economic development threats.

Key Highlights of the Address

- **Drought as a Core Development Crisis:** Escalating dry spells directly threaten food security, rural livelihoods, biodiversity, and macroeconomic stability.
- **Technology & Early Warning:** Stressed early identification using satellite imagery, predictive modelling, and local monitoring to act before dry spells escalate into disasters.
- **"Restore Forest Before Flow":** Emphasised riverscape forestry, catchment management, and soil water retention over piecemeal post-disaster financial packages.
- **Community-Centric Adaptation:** Advocated empowering local communities with actionable data to absorb climatic shocks.

Static Dimensions for UPSC (GS-I, GS-II & GS-III)

1. International Frameworks (GS-II)

- **UNCCD Context:** Established in 1994 following the 1992 Rio Earth Summit. It is the **only legally binding** international agreement directly linking environmental management to sustainable land stewardship.
- **The Three Rio Conventions:** UNFCCC (Climate Change), CBD (Biodiversity), and UNCCD (Land Degradation).

2. Drought Types & Vulnerability in India (GS-I & GS-III)

- **Types:** Meteorological (rainfall deficit), Hydrological (water storage depletion), Agricultural (crop moisture stress), and Socio-economic (supply-demand mismatch).
- **Indian Exposure:** Nearly 68% of India's net sown area is vulnerable to droughts in varying degrees, predominantly in semi-arid and dryland regions (e.g., Marathwada, Bundelkhand, Rayalaseema).

Minister seeks fundamental shift in fight against drought

Global approach to droughts must move from reactive relief to proactive resilience, says Environment Minister Bhupender Yadav while addressing UNCCD conference in Mongolia

The Hindu Bureau
NEW DELHI

There ought to be a fundamental shift in the global approach to droughts from reactive relief to proactive, technology-enabled resilience, Union Environment Minister Bhupender Yadav said at the United Nations Convention to Combat Desertification (UNCCD) conference in Mongolia on Tuesday.

Addressing international delegates at the Ministerial Dialogue on "Accelerating Drought Resilience" in Ulaanbaatar during the 17th Conference of Parties (COP17) to the UNCCD, Mr. Yadav warned that dry spells are rapidly escalating. Drought is "no longer an occasional event, but a defining development challenge", he said, citing its compounding disruptions to global water security, agricultural food systems, biodiversity, and economic stability.

'Restore the forest'
He highlighted India's coordinated, multi-institu-

Union Minister Bhupender Yadav says droughts are no longer an occasional event, but a defining development challenge. FILE PHOTO

tional approach integrating early warning, mitigation, relief and community resilience. Rainfall monitoring and satellite-based drought assessments trigger preparedness at the inter-ministerial and State levels, ensuring that a dry spell does not escalate into a crisis. Emphasising the critical link between land and water, he called for restoring "the forest, before the flow", underscoring India's focus on catchment and riverscape forestry to reduce erosion, improve water retention and recharge groundwater. The Minister advocated

for integrating predictive technologies, localised early-warning monitoring, and proactive land management policies. The goal, he noted, is to equip vulnerable communities to anticipate and absorb environmental shocks rather than relying primarily on post-disaster relief.

Summit objectives

The ministerial talks form a central component of UNCCD COP17, hosted by Mongolia under the theme "Restoring Land. Restoring Hope". Adopted in 1994 following the 1992 Rio Earth Summit, the UNCCD

is one of the three major Rio Conventions – alongside the framework conventions on climate change (UNFCCC) and biological diversity (CBD). It stands as the sole legally binding international agreement linking environmental management directly to sustainable land stewardship.

The 17th conference serves as a pivotal negotiation platform as land degradation currently impacts up to 40% of the planet's land surface, undermining the livelihoods of billions of people worldwide.

During these biennial sessions, delegates from 197 member parties – alongside civil society leaders, scientists, and international financial institutions – convene to negotiate binding frameworks and policy guidance.

The agreements negotiated at COP17 aim to translate high-level environmental commitments into measurable, investable solutions for water and food security over the next decade.

3. Institutional & Policy Interventions (GS-III)

- **Catchment Forestry:** Integrating Afforestation with watershed restoration (NMCG, CAMPA).
- **National Initiatives:** Pradhan Mantri Krishi Sinchayee Yojana (PMKSY - Per Drop More Crop), MGNREGA (water harvesting assets), and Drought Management Manual (2016).
- **Space Technology:** Soil moisture tracking using ISRO satellites for real-time drought trigger assessments.

Key Challenges in Implementing Proactive Resilience

- **Data Disconnect:** Lag between high-resolution satellite warnings and field-level execution by district authorities.
- **Financial Constraints:** Global climate finance remains skewed toward post-disaster relief rather than long-term ecological restoration.
- **Over-extraction of Groundwater:** Unregulated tube well usage negates recharge efforts made through watershed management.

Conclusion & Way Forward

Shifting from relief to resilience requires synchronising nature-based solutions with early-warning technology. India's paradigm of integrated watershed management and riverscape forestry offers a practical blueprint for UNCCD member nations. To safeguard vulnerable agrarian communities, global governance must prioritize long-term land restoration finance over emergency relief expenditures.

Daily News Analysis

UPSC Prelims Practice Questions

Question: Consider the following pairs:

Type of drought	Characteristic
1. Meteorological drought	Deficiency in precipitation
2. Agricultural drought	Insufficient soil moisture for crops
3. Hydrological drought	Depletion of surface and groundwater resources
4. Socio-economic drought	Failure of water availability to meet demand for goods and services

Which of the pairs given above are correctly matched?

- A. 1 and 2 only
- B. 1, 2 and 3 only
- C. 2, 3 and 4 only
- D. 1, 2, 3 and 4

Ans: D)

UPSC Mains Practice Questions

Question: "Drought is no longer merely a meteorological phenomenon; it is increasingly becoming a systemic socio-economic crisis." Explain the different types of drought and examine their cascading impacts on Indian society and economy. **(10 Marks, 150 Words)**

The 2026 monsoon highlighted a growing divergence between macroscopic climate predictability and localized, sub-seasonal weather reality. While global coupled dynamic models successfully forecasted the 2026 El Niño, they struggled to capture spatial and temporal intra-seasonal variations—such as the sharp swing from a 40% rainfall deficit in June to a 1% surplus in July. This breakdown underscores the challenge of modeling monsoon behavior under the compounding influences of global warming and anthropogenic land-use changes.

Models struggled to predict the 2026 monsoon's rapid changes

While one bad year is no reason to panic, it must also serve as an opportunity to identify the key issues that remain; for instance, will combinations of the El Niño and global warming make the monsoon unpredictable at sub-seasonal and local scales? How will models prepare for such a future?

Raghu Murtugudde

Climate models predicted the 2026 El Niño during early spring, just as they had in 2023. And the predictions have turned out to be accurate, with the robust evolution of a strong El Niño by the summer.

Models had predicted the 2023 monsoon to be slightly deficient, and the final seasonal total, at 94% of the long period average, essentially validated the forecasts. Monsoon predictions this year have already called for a deficit of greater than 10% and it will also likely hold true.

But the real cause for concern is the erratic and unprecedented evolution of the monsoon across space and time in 2026, which the models have not been able to capture even a few days in advance.

The key question now is whether the challenges posed by the 2026 predictions were an aberration, and, if so, why. In other words, do the models need to do anything dramatic to ensure they do better in the coming years? Or is it just a trend to be expected for the monsoon system, which has only become more notorious for its vagaries?

Expectations of improvements

The El Niño is one of the most predictable modes of natural variability. But models being able to predict its occurrence to the tune of 80% still means they will be wrong one-fifth of the time. The failed La Niña prediction of 2024 is a good example. Models' ability to predict the monsoon is much lower, hovering at around 60%, which means prediction failures will also occur more often. And this is for the all-Indian monsoon rainfall (AIMR); long lead forecasting of monsoon onset and space-time evolution are even greater challenges.

This year's monsoon onset over Kerala was predicted to be delayed, and it was, by a few days. But everything after that has been a whiplash. Rainfall in June was 40% below normal but July recovered quickly to 1% above normal. At the same time, these AIMR values hardly captured the heartache of farmers, who suffered much larger deficits over their arable land.

India's multi-tiered prediction systems cover short (days 1-3), medium (days 3-10), and extended (weeks 2 and longer) range demands for weather information. Seasonal to interannual predictions of AIMR are relatively easier; long lead predictions of spatial and temporal monsoon evolutions face irreducible uncertainties at present.

While one bad year is no reason to panic, it must also serve as an opportunity to identify the key issues that remain. For instance, are we going to

Motorists navigate through a water-logged street in following a sudden downpour on Tuesday in New Delhi. SUSHIL KUMAR VERMA

have more years of such erratic monsoon evolution? Will combinations of the El Niño and global warming make the monsoon unpredictable at subseasonal and local scales? And how will models prepare for such a future, to better help the country maintain its progress towards becoming economically developed?

Knowns and unknowns

The monsoon domain is blessed with more than a century's worth of data. Experts have extracted significant knowledge from this rich dataset of monsoon variabilities in space and time, and have made considerable advances in understanding the intrinsic timescales of active-break cycles, the onset becoming more erratic, delayed withdrawal, switching between extreme dry and wet events, more frequent extreme wet spells over Northwest India, and so on.

However, their understanding of the mechanisms underlying these events remains incomplete. The hope is that complete climate models with coupled land-ocean-atmosphere components can shed light on the missing links and help scientists make better, more skillful predictions.

The multi-tiered approach taken to develop separate tools for short, medium, and extended range predictions has yielded many impressive advances in useful predictions for various sectors, including agriculture, water, energy, health, and so on.

At present, the most promising avenues for further advances in

Climate models' ability to predict the monsoon is low, hovering at around 60%, which means prediction failures will also occur more often — and this is just for the all-Indian monsoon rainfall

improving models and predictions are likely to come from using artificial intelligence (AI) tools.

The dearth of mechanistic understanding is not a limitation for AI since these tools can extract patterns from the data and based on that make predictions, without any knowledge of the governing physics.

That said, experts must overcome one critical limitation in the course of combining AI with climate models: they must ensure they collect sufficient data to cover all aspects of the monsoon and its drivers at all the relevant spatial and temporal scales. In fact, this data must also account for the local amplifiers of extreme weather, such as land use change, urbanisation, deforestation, and irrigation.

That said, given new technologies and platforms, the volume and value of data will only grow. And AI models are already advancing optimal and cost-effective observation networks and improving our knowledge of processes, models, and predictions. AI is also proving to be indispensable for bringing global predictions at the scale of several kilometres down to farm and neighbourhood scales, for sector-specific

advisories and early warnings.

Public-private partnerships are also part of the landscape today when it comes to delivering weather and climate services.

Predictions and expectations

As predictions get better, so do the expectations. Specifically, advances in predictions related to the monsoon, including its onset, evolution, extreme dry/wet events, and withdrawal, also allow the users of these data to believe they can expect even better in future.

To this end, hybrid dynamic and AI models could deliver sector-specific predictions at the requisite space-time scales for users to better manage disasters, farm-related decisions, and water and energy use.

Extensively engaging users with

sustained feedback can pave the way for decision support products to be co-produced with the people who make those decisions. Predictions will never be perfect but they can continue to serve user needs by staying within the level of uncertainty a user can tolerate. In the coming years, policymakers, lawmakers, farmers, health workers, energy companies, and insurance providers can expect to be served bespoke forecasts. Global warming will keep throwing monkey wrenches into prediction systems but observations, dynamic models, and AI will continue to step up to the challenges.

(Raghu Murtugudde is an Earth Systems Scientist and a visiting professor at IIT Kanpur. murtugudde@iitk.ac.in)

THE GIST

India's multi-tiered prediction systems cover short (days 1-3), medium (days 3-10), and extended (weeks 2 and longer) range demands for weather information.

The real cause for concern is the erratic, and unprecedented, evolution of the monsoon across space and time in 2026, which the models have not been able to capture even a few days in advance.

At present, the most promising avenues for further advances in improving models and predictions are likely to come from using artificial intelligence (AI) tools.

Core Challenges in Current Monsoon Modeling

- **Spatial and Temporal Vagaries:** Coupled models predict All-India Summer Monsoon Rainfall (AIMSR) reasonably well at seasonal scales (approx. 60% accuracy). However, they face high uncertainty when predicting local break-active spells, onset surges, and regional extremes.

Daily News Analysis

- **Non-Linear Climate Interplay:** Global warming alters traditional teleconnections (e.g., El Niño Southern Oscillation and Indian Ocean Dipole). Warmer atmospheric temperatures increase moisture-holding capacity (Clausius-Clapeyron relation), leading to localized short-duration, high-intensity rainfall events.
- **Local Amplifiers:** Dynamics like urban heat islands, deforestation, land-use shifts, and intensive irrigation alter local microclimates. Traditional physical models often fail to parameterize these fine-grained variables.
- **Limitations of Purely Dynamic Models:** High computational costs and gaps in ocean-atmosphere-land physics hinder traditional Earth System Models from providing hyper-local, sub-kilometer forecasts.

Static Dimensions & Constitutional Context (UPSC Relevance)

- **Physical Geography (GS Paper I):**
 - Mechanism of the Indian Monsoon: Southwest monsoon branches, intra-seasonal oscillation (ISO), Madden-Julian Oscillation (MJO), and Equatorial Indian Ocean Oscillation (EQUINOO).
 - Climate Change & Extreme Events: Increased frequency of localized mini-cloudbursts and prolonged dry spells.
- **Governance & Disaster Management (GS Paper III):**
 - **Article 21 (Right to Life):** Extends to climate resilience, disaster mitigation, and safeguarding agricultural livelihoods.
 - **Federal Framework:** Agriculture and Water are State subjects (List II), while Disaster Management relies on national frameworks (NDMA Act, 2005). Accurate forecasts are vital for inter-state water sharing and disaster preparation.
 - **Economic Security:** Agricultural production relies heavily on monsoon performance, directly affecting food security, rural demand, and retail inflation targeting (RBI framework).

The Road Ahead: Hybrid Physics-AI Modeling

- **Integrating AI/ML:** Artificial Intelligence can detect complex non-linear patterns from multi-decadal datasets without requiring explicit physics parameterization, offering faster and cheaper downscaling.
- **Hybrid Dynamic-AI Frameworks:** Combining physics-based models (for conservation laws) with AI algorithms (for local micro-scale dynamics) improves prediction at farm and neighborhood levels.
- **Expanding Observation Networks:** High-density Doppler Weather Radars (DWR), ocean buoys, and satellite sensors are essential to train machine learning tools on local micro-variables.
- **Public-Private-Community Partnerships (PPCP):** Co-producing sector-specific advisories (e.g., crop-specific climate risk insurance, urban flood warning systems like I-FLOWS) directly addresses end-user tolerance for forecast uncertainty.

Conclusion

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

The unpredictability of the 2026 monsoon serves as a reminder that seasonal forecasting is no longer sufficient for socio-economic planning. To protect rural livelihoods and urban infrastructure from climate volatility, India must move toward hybrid forecasting platforms that merge physical dynamics with artificial intelligence. Upgrading forecasting tools from macro-regional estimates to hyper-local, actionable insights is essential for climate resilience and sustainable economic growth.

UPSC Prelims Exam Study Questions

Question: The Clausius-Clapeyron relationship is particularly relevant to climate studies because:

- A. It explains the reversal of ocean currents during El Niño.
- B. It establishes a relationship between atmospheric temperature and the moisture-holding capacity of air.
- C. It explains the formation of the subtropical jet stream.
- D. It determines the duration of the southwest monsoon over India

Ans:B)

UPSC Mains Exam Study Questions

Question: "The Indian monsoon is a complex coupled ocean-atmosphere-land phenomenon rather than a simple seasonal wind reversal." Explain the major factors governing its spatial and temporal variability. **(10 Marks, 150 Words)**

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

Page 08 :GS III :Science and Tech

The editorial highlights a critical paradigm shift in India's space ecosystem. Historically, space achievements served as symbols of national prestige and technological capability for a developing nation. Today, however, space infrastructure has evolved into the core operational backbone of global communications, finance, weather monitoring, and national defense.

While celebration of milestone achievements like Chandrayaan-3 remains important, the long-term viability of India's private and public space sectors will depend on commercial competitiveness, cost efficiency, and high-frequency launch reliability rather than public romanticism or national prestige.

Key Issues & Challenges Highlighted

- **High Cost per Kilogram to Orbit:** According to recent economic analyses, launching a kilogram into Low-Earth Orbit (LEO) via Indian rockets costs roughly **\$13,302/kg**, significantly higher than the global average (**\$3,868/kg**) and competitors like China (**\$5,809/kg**) or the US (**\$3,225/kg**).
- **Low Launch Frequency:** In 2025, India achieved only 5 launches against a target of 30. Low operational cadence prevents economies of scale and slows the accumulation of flight-proven reliability records.
- **Payload Capacity Constraints:** The operational payload limit of ISRO's heaviest launcher, LVM-3, forces heavy domestic satellites (e.g., GSAT-N2 at 4,700 kg) to rely on foreign commercial providers like SpaceX.
- **Commercial Reliance on Foreign Launchers:** Indian private space startups (e.g., Pixxel, Digantara) frequently choose global operators for launch reliability and cost efficiency, bypassing domestic options.
- **Global Market Dominance:** SpaceX currently lofts over three-quarters of global payload capacity, creating a near-monopolistic standard for cost and turnaround time that new market entrants must contend with.

Static Dimensions & Constitutional Context (UPSC Relevance)

- **General Studies Paper III (Science & Technology):**
 - **Indian Space Association (ISpA) & IN-SPACe:** Regulatory frameworks designed to decentralize ISRO's burden by enabling private sector Participation in launch vehicles, ground stations, and satellite fabrication.
 - **Space Policy 2023:** Division of responsibilities among ISRO (R&D), IN-SPACe (authorization/regulation), and NSIL (commercialization).
 - **Indigenization of Technology:** Development of Next-Generation Launch Vehicles (NGLV) with reusable technology to lower launch costs per kilogram.
- **General Studies Paper III (Economy & Infrastructure):**

Escape velocity

India's space sector must focus on reliability and regular launches

For much of the 20th century, a rocket tearing a white seam through the sky did for India roughly what football did for Argentina and Brazil. Nations shut out of the councils where economic and strategic weight was measured found, in a game of European origin, an arena where their poverty did not disqualify them. Mastery was open to anyone with nerve and skill. Space was other things but also India's football. A famished, newly independent republic that could barely feed itself nevertheless chose to gamble on rockets and atomic piles – an expensive bet on a future it could not yet see. In that era of a controlled economy and state broadcaster monopoly, a launcher rising was its own justification. The utility of its payload was secondary, in the eyes of the masses, to the veneer of technological competency. Today, rockets and satellites are no longer emblems; they are the plumbing of the information age, the unglamorous scaffolding beneath navigation, banking, weather and war. On the third National Space Day – the anniversary of Chandrayaan-3's touchdown in the lunar south polar region – Prime Minister Narendra Modi urged 20 space-startup founders to build an "aura" that would draw the world's talent to India. But that might be a wrong framing married to the old view of space. A private space sector cannot harvest success merely because its wares are called rockets and launch vehicles; the romance that carried the state programme will not carry a business.

A recent peer-reviewed analysis in *Economics Letters* by Alessio Terzi and Francesco Nicoli finds that it cost \$13,302 to loft a kilogram into low-earth orbit on an Indian rocket in 2025 – costlier than China (\$5,809), Japan, Russia, Europe and the United States (\$3,225), and well above the global average of \$3,868. That is because India launches too rarely and uneconomically to rapidly build the required reputation for reliability. There were only five launches in 2025, against the 30 that were projected. The consequence is visible. GSAT-N2, at 4,700 kg too heavy for ISRO's LVM-3, went up on a Falcon 9; Pixxel and Digantara – two of the 20 at Mr. Modi's meeting – rode SpaceX to orbit. SpaceX alone put three-quarters of the world's payload into orbit in 2025, underlining its near monopolistic stranglehold but also pointing to opportunities. The value of India's space sector can no longer rely on aura but in jobs, in long-term capital and the tax revenues that follow and, in heavy-lift launches that undercut SpaceX and China. Moon bases with NASA and interplanetary reveries belong to the new imagination of space, and they matter – but they are the ornament, not the engine.

Daily News Analysis

- **FDI in Space Sector:** Recent policy liberalizations allowing up to 100% Foreign Direct Investment (via automatic and government routes depending on the sub-sector) to attract long-term capital.
- **Economic Value Creation:** Shifting the focus from state-funded exploratory missions to high-value industrial employment, manufacturing supply chains, and export tax revenues.
- **Governance & National Security:**
 - Space domain awareness, dual-use satellite infrastructure for border surveillance, secure military communications, and satellite-based navigation systems (NavIC).

Strategic Roadmap for the Space Sector

- **Develop Reusable & Heavy-Lift Capability:** Prioritize operationalizing reusable launch vehicles (RLVs) and expanding LVM-3/NGLV payload capacities to lower the cost-per-kg to globally competitive levels.
- **Scale Private Launch Ecosystem:** Shift routine satellite manufacturing and small-satellite launch operations (SSLV) fully to private consortia, allowing ISRO to focus exclusively on advanced R&D and deep-space exploration.
- **Establish Launch Cadence & Infrastructure:** Expand launchpad infrastructure at Sriharikota and the upcoming Kulasekarapattinam spaceport to increase turn-around rates and meet projected launch schedules.
- **Focus on Downstream Applications:** Build domestic capabilities in Earth observation data processing, satellite communication services, and space-situational awareness platforms to capture high-value market segments.
- **Foster Public-Private Partnerships:** Encourage domestic private startups to utilize ISRO's testing facilities while securing anchor tenancy agreements where the government acts as an early buyer of private space services.

Conclusion

India's space sector is at a pivotal junction where narrative-driven prestige must give way to industrial competitiveness. To secure a meaningful share of the global space economy, national strategy must focus on building cost-effective heavy-lift capacity, achieving regular launch cadences, and enabling domestic startups to compete globally. Deep-space exploration and lunar missions showcase technological ambitions, but sustained commercial viability and operational reliability remain the indispensable engines of long-term sector growth.

UPSC Mains Exam Study Questions

Question: "India's space programme must transition from a technology-demonstration model to a globally competitive space industry." Discuss the major challenges and opportunities involved in this transition. **(10 Marks, 150 Words)**

The August edition of the Reserve Bank of India (RBI) Bulletin's 'State of the Economy' article outlines a resilient domestic economy navigating significant global and micro-level headwinds. While domestic economic drivers maintain strong momentum, external volatility—such as West Asian geopolitical friction and trade policy shifts—poses ongoing risks to input supply chains and business sentiment.

Key Macroeconomic Indicators & Drivers

- Domestic Demand Dynamics:** Buoyant consumption remains the cornerstone of domestic growth. Rural demand displays strong recovery, evidenced by accelerated vehicle and tractor sales (tractor sales rose 28.1%, two-wheelers 28.3%). Petroleum product consumption returned to positive territory after three months of contraction, signaling robust ground-level economic activity.
- Inflationary Trajectory:** Headline Consumer Price Index (CPI) inflation edged up marginally to 4.45% year-on-year (YoY) in July from 4.38% in June. This uptick was primarily driven by food supply-side shocks (meat, eggs, and spices registering double-digit inflation). Crucially, core inflation remained steady (3.9%), reflecting a limited pass-through of input cost pressures to broader consumer baskets.
- Monsoon Recovery & Kharif Sowing:** A recovery in monsoon activity during July offset the initial June deficit, helping total Kharif sown area approach previous-year levels. However, elevated food prices in early August highlight ongoing weather-driven risks to agriculture.
- Trade & External Vulnerabilities:** Merchandise exports hit a 4-month high, but imports expanded faster, widening the merchandise trade deficit. The gap was driven mainly by electronics imports. Elevated Indian Basket crude oil prices (~\$89.7/barrel) and fresh US tariff adjustments remain structural uncertainties.

War weighing on business confidence, says RBI bulletin

'Domestic demand remains buoyant, as reflected by various indicators including vehicle sales; petro products consumption on positive territory'

Lalatendu Mishra
MUMBAI

The West Asia conflict remains a challenge to the supply chains of oil and other key commodities, and is weighing on business confidence, Reserve Bank of India (RBI) officials stated in the August edition of the RBI Bulletin released on Tuesday.

The new U.S. tariffs compounded the uncertainty to international trade, they said in the 'State of the Economy' article, adding that despite this the global economy was expanding, though with inflationary pressures. Stating that the Indian economy continued to display strength notwithstanding these headwinds, they said it was on account of the country's "robust macroeconomic fundamentals" that continued to "provide cushion to the domestic economy."

They said domestic demand remained buoyant, as reflected by several indicators, including vehicle and tractor sales.

Petroleum products' consumption growth returned to positive territory after three straight months of contraction, they pointed out. Both merchandise exports and imports grew strongly in July 2026, with

The pick up in monsoon activity during July supported kharif sowing, taking it closer to the previous year's level. PTI

exports growing at a four-month high (in 2026-27 so far). Merchandise trade deficit widened in July, both sequentially and on a year-on-year (YoY) basis, reflecting a widening of deficit in electronic goods.

The pick up in monsoon activity during July supported kharif sowing, taking it closer to the previous year's level, they observed.

Headline consumer price index (CPI) inflation increased, marginally to 4.45% YoY in July 2026 from 4.38% in June, driven by 'food and beverages', while core inflation remained unchanged.

Eight out of 12 divisions witnessed a sequential increase in inflation in July. "While headline CPI inflation edged up above the target, it was primarily on account of supply side pressures. Stable core inflation reaffirmed the lower pass-through of cost

pressures," they emphasised. The increase in food and beverages inflation remained broad-based with meat, eggs, and spices registering double-digit inflation. On a month-on-month (MoM) basis, indices for all sub-components of 'food and beverages' registered a positive momentum in July. Fuel inflation edged up marginally in July, they said.

As per the article, during August (so far till 21st), high-frequency data suggest a broad-based sequential increase in food prices. Among cereals, rice and wheat prices continued their upward trajectory, though their pace of MoM increase stabilised. "With in pulses, prices of all the major constituents inched up over previous month. Edible oil prices registered broad-based increases, led by mustard and palm oil," the officials stated.

Static Dimensions & Constitutional Framework (UPSC Relevance)

- General Studies Paper III (Economy & Monetary Policy):**
 - Monetary Policy Framework:** The RBI's target under the Flexible Inflation Targeting (FIT) framework is 4% ($\pm 2\%$). The persistent gap between headline inflation (4.45%) and target limits room for immediate rate cuts, keeping the repo rate on hold (5.25%).
 - Food Inflation vs. Core Inflation:** Supply-side shocks (e.g., volatile agricultural output) require structural supply-chain interventions rather than pure demand-side monetary contraction.

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

- **Trade Balance & External Sector:** High merchandise deficits underline domestic structural gaps in capital and intermediate goods manufacturing (e.g., electronics assembly dependence).
- **Constitutional & Policy Context:**
 - **Article 293 / Fiscal Federalism:** Stable state revenues driven by robust GST growth (15.4% YoY) support sub-national capital expenditure.
 - **Union List (Entry 42 - Foreign Trade & Entry 36 - Currency/Foreign Exchange):** Union responsibility to cushion external trade shocks and maintain currency stability via macro-prudential tools and forex reserves management.

Policy Imperatives & Strategy

- **Targeted Food Supply Management:** Mitigate food price volatility through strategic buffer releases, targeted import duty adjustments on edible oils/pulses, and enhanced agricultural logistical efficiency.
- **Diversification of Energy & Supply Chains:** Accelerate strategic petroleum reserve build-ups and shift toward localized electronics component manufacturing (via Production Linked Incentive - PLI schemes) to reduce structural import deficits.
- **Monetary Vigilance:** Maintain a "wait-and-watch" stance on interest rates, ensuring second-round effects from elevated food/fuel prices do not de-anchor long-term inflation expectations.
- **Strengthening Export Competitiveness:** Mitigate tariff shocks by deepening bilateral trade agreements with non-traditional export markets (e.g., Latin America, Africa, and West Asia).

Conclusion

The Indian economy demonstrates underlying resilience, anchored by robust rural and urban demand, steady corporate balance sheets, and contained core inflation. However, elevated headline food inflation, volatile crude prices, and unpredictable monsoon patterns require coordinated fiscal and monetary vigilance. Navigating these supply-side disruptions will depend on targeted food management, supply chain localization, and sustained infrastructure investment to maintain medium-term growth momentum.

UPSC Prelims Exam Study Questions

Question: A sudden increase in vegetable prices due to crop failure, while aggregate demand remains broadly unchanged, would primarily represent:

- A. Demand-pull inflation
- B. Cost-push inflation caused by a supply shock
- C. Monetary inflation
- D. Structural deflation

Ans: B)

End the culture of secrecy in judicial appointments

The debate over transparency in judicial appointments has resurfaced after Justice Ujjal Bhuyan of the Supreme Court of India recently observed that greater openness in the collegium process would strengthen public confidence and help ensure that merit remains the governing principle. Reformers argue that insulation from political interference was never meant to become insulation from constitutional accountability itself – a question that has remained unresolved for three decades.

The collegium is a judicial creation, not a constitutional one. The First Judges Case (1981) gave the executive primacy in appointments; the Second Judges Case (1993 4 SCC 441) shifted primacy to the collectively formed opinion of the Chief Justice of India and senior judges; the Third Judges Case (1998 7 SCC 739) expanded this into today's five-member collegium. The reasoning was sound, but close to three decades later, the process remains among the least transparent in any major constitutional democracy: no notification of vacancies, no eligibility matrix, no known methodology for assessing candidates. Even Fali Nariman, credited as an architect of the collegium, later turned critic, recalling that it was 'not receptive at all' to the Bar. When the system's own architects concede that it answers to no one, reform can hardly be called interference.

Resolutions without reasons

One has the example of the collegium's own record on disclosure, which has moved backwards, not forwards – perhaps the clearest evidence of an institution retreating deeper into opacity. In October 2017, it began publishing resolutions with brief reasons for elevation, a step then hailed as a foundation for transparency.

That practice thinned steadily, and since November 28, 2024, resolutions have stopped naming which members took part in a decision or disclosing any reasoning at all. In November 2025, (then) Chief Justice of India (CJI) B.R. Gavai confirmed that the collegium had resolved to stop publishing detailed reasons altogether, citing concern that disclosure could harm the career prospects of candidates – a rationale that would equally justify withholding reasons from every rejected litigant.

This cannot be seen in isolation: the Court, in the *MediaOne* judgment (2023), held that sealed-cover secrecy is 'antithetical to a transparent and accountable system'. If that principle governs the court's own cases, why should a lesser standard govern its own?

This absence of due process has fuelled a recurring allegation: that opacity has allowed

Puhazh Gandhi P.

Lawyer and political analyst who writes on the Constitution, commerce and policies

relatives of sitting and retired judges – the so-called 'Uncle Judges' – an easier passage to the Bench than first-generation lawyers with no lineage to lean on. It is important to remember this is not a complaint from critics from outside alone: former CJI R.M. Lodha himself remarked that nearly one in three High Court judges could be an 'uncle'.

The allegation is not anecdotal: in 2018, the Union government flagged 11 of the 33 names recommended by the Allahabad High Court collegium, noting that they were relatives of sitting or retired judges. A broader assessment in 2025 found that nearly 30% of the Supreme Court judges – roughly 10 of 33 – had familial links to former judges. In January 2025, this issue pushed the collegium to consider barring judges' kith and kin from consideration altogether (the proposal was discussed and in principle it was agreed to have higher scrutiny if candidates are relatives, but legally a bar was not created). That, in itself, is an admission that without a publicly defined selection matrix, there is no objective way to distinguish a meritorious relative from a beneficiary of judicial lineage.

This is where the judiciary's own jurisprudence turns inward. Articles 14 and 16 guarantee equality and equal opportunity in public employment. In *Secretary, State of Karnataka and Others vs Umadevi* (2006 4 SCC 1), the Court held that appointments to public office cannot be made through backdoor methods and must ordinarily follow a transparent procedure open to eligible candidates. If constitutional equality demands openness in the recruitment of a clerk or an engineer, why should the highest constitutional offices remain exempt from comparable standards? To be sure, judicial appointments cannot be reduced to a competitive examination; qualities such as independence and temperament resist quantification. But, qualitative judgment does not require the total absence of procedure. It is prudent to note the irony: the Court itself held, in *CPIO vs Subhash Chandra Agarwal* (2019 3 SCC 1), that the CJI's office falls within the Right to Information Act – a logic never extended to how judges are appointed.

What other democracies do

Other constitutional democracies show that transparency and judicial independence can coexist. In the United Kingdom, the Judicial Appointments Commission publicly advertises vacancies and conducts structured interviews; in South Africa, the Judicial Service Commission invites nominations publicly and conducts televised interviews. None of these systems is

flawless, but each rests on a premise that India has yet to accept: independence is strengthened, not weakened, when citizens understand how judges are chosen.

India's collegium continues to operate as though it belongs to an earlier era of institutional deference. Political theorist Jürgen Habermas argued that democratic legitimacy ultimately rests on the public sphere – an arena where institutions must justify themselves before informed citizens.

This is not abstract: every judicial appointment is now dissected on social media within minutes. The scrutiny of a CJI's own remark comparing youngsters to 'cockroaches' travelled from placards at Jantar Mantar to trending hashtags within hours; it will not take long for such movements to arrive at the doorstep of the higher judiciary itself. Contempt jurisdiction, built for the newsroom and the courtroom gallery, cannot be used to trifle the scrutiny of this scale and anonymity – it is an alarm bell for a system that still keeps its own appointments behind closed doors and resists constructive criticism. Institutions that embrace reform voluntarily emerge stronger; those that resist witness a slow erosion of the legitimacy they seek to protect.

Reform, not retreat

None of this requires dismantling the collegium; it only requires modernising it. A transparent framework could publish anticipated vacancies in advance, invite applications from eligible advocates, disclose objective eligibility criteria, and record reasoned recommendations explaining why one candidate was preferred over another. Confidential inputs on integrity can remain protected – transparency does not demand disclosure of every file, only openness about the process, the criteria and the reasoning behind constitutional appointments.

This is ultimately not a contest between the judiciary and the executive, nor an attempt to weaken judicial independence. It is a question of whether one constitutional value is allowed to eclipse another. The Constitution promises an independent judiciary, but, equally, promises equality, fairness and reasoned decision-making; values that are complementary, not adversarial. The debate of the 1990s was executive versus judiciary. The debate of this decade is opacity versus transparency. Therefore, unless the collegium accepts that independence without accountability breeds the very distrust it was designed to prevent, this asymmetry between what the judiciary demands of every other institution and what it permits of itself will continue to exist.

The judiciary that demands transparency from every institution of governance cannot ask citizens to trust it on faith alone

GS Paper II: Indian Polity

UPSC Mains Exam Practice Questions: How do Articles 14 and 16 provide a constitutional framework for examining concerns of fairness and equal opportunity in appointments to public offices? Can these principles inform reforms in judicial appointments? Discuss. (10 Marks, 150 Words)

Context :

The ongoing debate surrounding the **Collegium system** of the Supreme Court of India highlights a critical constitutional paradox: Does judicial independence necessitate institutional opacity? Based on an analytical piece by Puhazh Gandhi P. titled "End the culture of secrecy in judicial appointments," this issue bridges core aspects of Indian Polity and Governance (UPSC CSE General Studies Paper-II).

The debate shifted from "Executive vs. Judiciary" in the 1990s to "**Opacity vs. Transparency**" today. Institutional reforms must modernize the appointment process without diluting judicial independence.

Key Highlights & Critical Analysis

- **Evolution of the Collegium:**

- First Judges Case (1981): Executive primacy in appointments.
- Second Judges Case (1993): Primacy shifted to the Chief Justice of India (CJI) and senior judges.
- Third Judges Case (1998): Established the current 5-member Collegium.
- Critique: Born out of judicial interpretation rather than explicit constitutional text, leading to zero statutory notification of vacancies, lack of an eligibility matrix, and undisclosed evaluation methodologies.

- **The Trend Towards Opacity:**

- October 2017: The Collegium briefly published resolutions with short rationales.
- November 2024–2025: Detailed reasons and participant details were ceased altogether to protect candidate career prospects—a rationale rarely extended to ordinary litigants.

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

- Internal Inconsistency: Contrast this with MediaOne (2023), where the Supreme Court ruled that sealed-cover secrecy is antithetical to transparency, and Subhash Chandra Agarwal (2019), which brought the CJI's office under the RTI Act.

- **The "Uncle Judges" Phenomenon & Article 14/16 Concerns:**

- In 2018, the Union Government flagged 11 of 33 recommended names from the Allahabad High Court Collegium for familial ties to sitting/retired judges.
- Concerns persist regarding equality of opportunity for first-generation lawyers versus candidates with judicial lineage.
- Umadevi Case (2006): Established that public appointments must not follow "backdoor methods." Applying public employment standards under Articles 14 and 16 ensures constitutional fairness.

- **Global Best Practices:**

- United Kingdom: Judicial Appointments Commission (JAC) publicly advertises vacancies and conducts structured interviews.
- South Africa: Judicial Service Commission (JSC) invites public nominations and streams interviews.

Core Static Dimensions & Constitutional Links

1. **Articles 124(2) & 217:** Govern the appointment of Supreme Court and High Court judges by the President "in consultation" with judges. The Collegium expanded "consultation" into "concurrence."
2. **Articles 14 & 16:** Equality before law and equal opportunity in public offices. Opacity in recommendations creates barriers for non-lineage advocates.
3. **National Judicial Appointments Commission (NJAC):** The 99th Constitutional Amendment Act (2014) sought to create a balanced appointment body but was struck down in the Fourth Judges Case (2015) to preserve the Basic Structure (Judicial Independence).
4. **Democratic Legitimacy (Habermas Principle):** Institutional authority rests on public trust generated through transparent mechanisms, not unchallengeable secrecy.

Actionable Blueprint for Collegium Reforms

To align the judiciary's internal mechanisms with its own jurisprudence, the system requires structural modernization:

- **Publish Anticipated Vacancies:** Announce openings in advance to open the pool to eligible advocates transparently.

No: 1521, Second Floor, H-Block, 5th Street, Anna Nagar, Chennai-40.

Ph: +91 8754543687, www.gurukulamias.in

Daily News Analysis

- **Define an Objective Selection Matrix:** Establish verifiable criteria for evaluating candidate merit, experience, integrity, and judicial temperament.
- **Publish Reasoned Collegium Recommendations:** Disclose non-sensitive grounds for selection while safeguarding confidential background/integrity reports.
- **Establish a Secretariat:** Create an independent, permanent administrative body to process applications, run background verifications, and compile objective data before Collegium review.

Conclusion

Judicial independence and constitutional accountability are **complementary, not adversarial**. Preserving public faith in the higher judiciary demands moving away from deep opacity toward open procedures. By embracing structured transparency—like public vacancy notices, objective criteria, and reasoned selection—the Collegium can eliminate allegations of favoritism, uplift first-generation legal talent, and strengthen its democratic legitimacy.
